

key relationships, a best practice is to create a CDS view. This CDS view could simply involve joins on the related tables. CDS views involve the least amount of coding and can be reused in multiple objects across developments. In other words, a CDS view is a database artifact that can be consumed across objects/applications.

## **ABAP-Managed Database Procedures (AMDP)**

An AMDP is a piece of code executed in the [SAP HANA](#) layer. The data it fetches includes some part of business logic to be performed on the fetched data. Usually, the business logic will be performed on vast amounts of data.

As shown in the figure below, when multiple result sets are needed and are part
